

Case Study

Solving the timesheet problem for Pure

The Client

Based in East Anglia, Pure Resourcing Solutions (PRS) is a professional recruitment specialist with offices in Cambridge, Norwich, Ipswich and Chelmsford. The firm specialises in accountancy, executive, office and human resources recruitment solutions.

The Challenge

PRS was looking for an electronic timesheet system that would let candidates and clients manage their timesheet activity themselves.

In addition, PRS wanted staff throughout its four East Anglia offices to share information in real time and between departments.

Lost and late timesheets had been creating complications and delays throughout the pay and bill process. PRS had resolved this in the short term through outsourcing but it wanted to absorb this activity within the business and reduce overall costs.

The Solution

By selecting the Revas InTime solution, PRS has gained an enhanced method of keeping track of its timesheets and solved the problem of lost and late timesheets.

Additional Client Benefits

In addition to this, the company has benefitted in the following ways:

Cost savings: the cost of processing timesheets, creating worker records in the payroll system and handling queries is reduced.

Accuracy: rapid, accurate and automatic billing, allowing managers to focus their time on more strategic issues.

Convenience: staff have 24/7 access to time, billing and payroll records from anywhere in the world.

Expertise: access to the proactive advice of Baker Tilly's full range of specialists.

Revas InTime was installed alongside the RDB Pro NET front-end system and the Pegasus Opera finance package.

PRS's needs were met by constructing a suite of reports that provided essential management information for its team. These included a special missing/late bulletin to alert consultants to those timesheets that were awaiting submission.

The company was then able to pursue the proactive approach it desired when managing delayed timesheets.

Seamless integration to the recruitment company's other new systems was also delivered. This meant that, once data relating to the placement was captured in PRS's existing front-end, Revas InTime could collect it automatically without the time-consuming process of re-keying data.

The Results

- 98% adoption by clients
- Timesheet processing time is significantly reduced
- Tailored management reports are generated quickly and easily
- Fully integrated systems minimising error rates and rekeying.

"Working together with Pegasus Opera and RDB Pro NET, Revas InTime provided a solution that we found cost-effective. They certainly helped us to speed up the process"

Ian Walters, PRS Director
